Experience

Data Engineer I

[Leapfrog Technology](#)

Remote

2025 – Present

- Build and maintain data pipelines in Python and SQL that load daily files from client systems into a warehouse, with checks for duplicate rows, missing days, and late data.
- Model clean tables with dbt for Power BI reports, with tests so a broken load fails before a report does.
- Made loads idempotent with file hashes, so a rerun never doubles the numbers.
- Work with analysts to define each metric once, in one place, so revenue means the same thing in every report.

Data Engineering Intern

Bengen

Lisbon, Portugal

2025

- Wrote SQL transformations and tests for a client warehouse and tracked data quality problems from the source files to the final report.
- Built a small monitor that compares each month's row count with the usual month and flags a jump.
- Cleaned and typed raw CSV exports (dates, currencies, units) into staging tables.

Junior Data Analyst Intern

Company C (placeholder)

Lisbon, Portugal

2024

- Built Power BI dashboards for weekly sales and stock reports.
- Answered ad hoc questions with SQL and Excel, and kept each metric definition next to its query.
- Checked report numbers against finance totals before they went out.

Scientific Initiation Intern

[Centro de Investigação de Montanha \(CIMO\)](#)

Bragança, Portugal

September 2023 – February 2024

- Measured physicochemical properties and analysed phenolic compounds with HPLC.
- Assessed antioxidant activity in vitro with the OxHLIA and TBARS assays.
- Processed the experimental data and wrote the final report.

Projects

recount

[Link to project](#)

- An MCP server for data, in Python on DuckDB. When Claude asks for a number, it runs the SQL, checks the tables, and returns the number with warnings.
- Four checks in one query each: duplicate ids, a month that doubled, old data, empty columns. Metrics defined once in a YAML file.

A warehouse on a laptop

[Link to project](#)

- Monthly files from Chicago's bike share into DuckDB, cleaned with dbt. 2.3 million real rides, 25 seconds to load.
- The loader stores a hash of each file and refuses a file it already has. A dbt test fails the build if a file is double or half the usual size.

Late deliveries and bad reviews

[Link to project](#)

- 96,470 real orders from a Brazilian marketplace, SQL on DuckDB. Late deliveries are 7% of orders and 37% of one-star reviews.
- Found that the cause is the promised date in some states and months, not the sellers. Three extra days on the promise cuts late orders from 6.8% to 4.8%.

Education

Master's degree in Food Science and Technology
NOVA School of Science and Technology (FCT NOVA)

Lisbon, Portugal
September 2025 – September 2027

Bachelor's degree in Chemical Engineering
Instituto Politécnico de Bragança

Bragança, Portugal
September 2021 – September 2024

Technical Skills

Languages: SQL, Python

Tools: DuckDB, dbt, Power BI, Tableau, Excel, Git/GitHub, pandas

Writing: Short illustrated posts on data analysis at manisha-subedi.github.io/blog
